Low Surface Brighness galaxies: $V_c$-$s_0$ relation and halo central density radial profile from stellar kinematics measurements

A. Pizzella

Ionized gas and stellar kinematics for a sample of 11 Low Surface Brighness galaxies (LSB) are presented. The sample galaxies have been observed along their major and minor axis. We present preliminary mass models of 3 objects based on the stellar kinematics and z-band imaging, aimed at deriving the dark matter spatial distribution. A second results concern the relation between the circular velocity $V_c$ and the central stellar velocity dispersion $s_0$. LSBs seem to follow a relation different from the one valid for high surface brightness galaxies, showing a higher $V_c$ for the same $s_0$.
