# Chapter 18 Fifty WSRT highlights

Richard Strom<sup>1</sup>, Thijs van der Hulst<sup>2</sup>, Arnold van Ardenne<sup>3</sup>

Ger de Bruyn felt that a leading telescope should produce about one outstanding result each year. He maintained a list of exciting science coming out of the WSRT, and when last updated it numbered 50 noteworthy results, about one per year with the 50th anniversary of the telescope soon upon us. Largely based on that with a few additions and modifications, the following pages represent WSRT milestones most of which are represented by an image as published by those who did the research. Most of the highlights concern astronomical results, though 10% fall in the categories of hard-/software development. Each highlight is presented with a minimum of descriptive text: the pictures should speak for themselves. Enjoy the almost abstract shapes, shades and colors which rolled out of the WSRT (a search of the Astrophysics Data System (ADS) will help satisfy the curious) – relish these WSRT highlights!

### Högbom CLEAN, 1974

### Hydrogen (HI) in galaxy M81, 1975

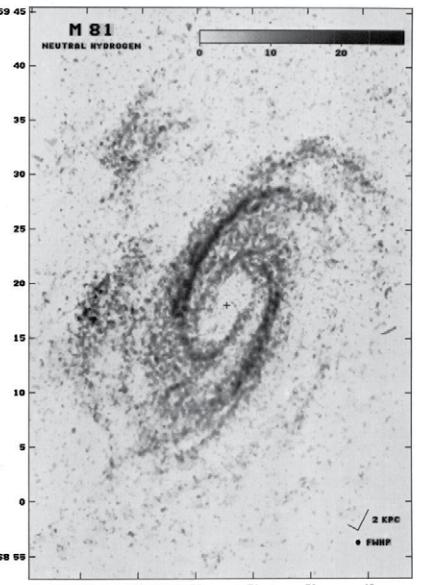

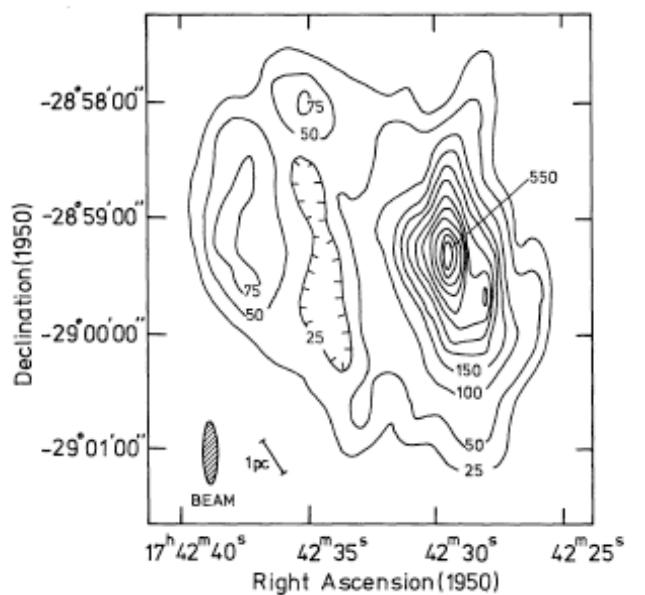

Fig. 3. Radiograph of the density distribution of HI in M 81. The half power beamwidth (FWHP) is shown in the lower right hand corner which also contains an indication of the linear scale in the plane of the galaxy; 6° corresponds to 1 kpc. The coordinates are right ascension and declination (1950.0). The gray scale is scaled in units of  $10^{-2}$  Janskys. (Photo projected using the VLA/UV Image Reconstruction System)
